

## Engineering Drawing

The drawings were sometimes really easy but also sometimes really time consuming and hard. Among the things I learned in the EDSGN class at Penn State were the various drawing to be applied in engineering, things like multi-view, isometric view and the various sectioning views.

My favorite was the isometric view as it forced you to really think topologically about what the shapes were like and stuff.

The multi-view allowed you to generate three different drawings from a single 3d picture, each showing a different perspective.
